ABSTRACT

ai An electron gun in a color CRT is provided for minimizing noise, spark, and neck damage in the CRT. The electron gun includes a plurality of stem pins for applying different voltages, an acceleration electrode, a third electrode, a fourth electrode, and a static electrode for forming pre-focus lenses. The electron gun also includes a dynamic electrode and an anode for forming a main focus lens. The static electrode and the dynamic electrode form a quadrupole lens. The electron gun also includes a bead glass for holding the foregoing electrodes at fixed distances, a wire having one end welded to the dynamic electrode and the other end welded to the stem pin with a dynamic voltage applied thereto, and a body of the wire between the one end and the other end of the wire, wherein the body of the wire is arranged so as not to pass through between an outer surface of the bead glass and an inner surface of the neck tube.
